

Host Failure Modelling

Description

This report predicts resource utilization in case of a host failure.

Report Parameters

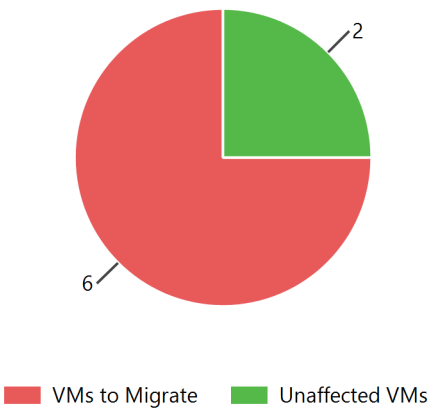

Scope:	Virtual Infrastructure
Number of failed hosts:	1
CPU utilization threshold:	90.00%
Memory utilization threshold:	80.00%
Business View migration scope:	

Summary

Virtual Infrastructure		Physical Resources		Resources Required	
Number of clusters:	2	CPU:	115.20 GHz	CPU:	0.00 GHz
Number of hosts:	4	Memory:	159.98 GB	Memory:	5.00 GB
Number of datastores:	13	Physical Resources after 1 hosts failure			
Number of VMs:	400	CPU:	57.60 GHz		
Number of powered on VMs:	8	Memory:	79.99 GB		

Modelling Results

VMs Migration Count

Available CPU Resources (GHz)

Available Memory Resources (GB)

Details

Cluster	Average CPU Usage (%)	Average Memory Usage (%)	Predicted CPU Usage (%)	Predicted Memory Usage (%)	Failed Hosts	Affected VMs
CDP cluster	6.97	46.25	13.95	92.50	1	6
					prgtwesx01-virt.tech.local	6
CDP cluster 2	0.31	5.18	0.62	10.35	1	
					prgtwesx04-virt.tech.local	

Recommendations

CDP cluster:

After 1 hosts failure, you will be above the defined 80% threshold for Memory by 5.00 GB but still within the capacity of the hardware

CDP cluster 2:

This Cluster has enough resources to maintain high availability after the failure of 1 hosts in this cluster
